

## Check Point Firewall Monitor Command

---

*(Ethereal trace format)*

Run fw monitor command at `$FWDIR/bin` on FireWall Gateway module:

**fw monitor -e "accept;" -o monitor.out**

Leave it running for 15-20 seconds before testing the problem.

Run "**CTL+C**" to stop monitoring

If you know the outside client's IP, you can set the source and destination addresses:

**fw monitor -e "accept src=10.10.10.1 or  
dst=10.10.10.1;" -o monitor.out**

*NOTE: 10.10.10.1 is an example; you need to replace it with your outside client's IP.*
